Step by step: getting a job to a trustworthy machine

1. The data owner posts a job and its rules, such as the required hardware and security level.

   In trade: *the exporter books a shipment on fixed terms.*

2. An executor whose machine fits pulls the job, guided by a common hardware description.

   In trade: *a courier picks a warehouse holding the right certificate.*

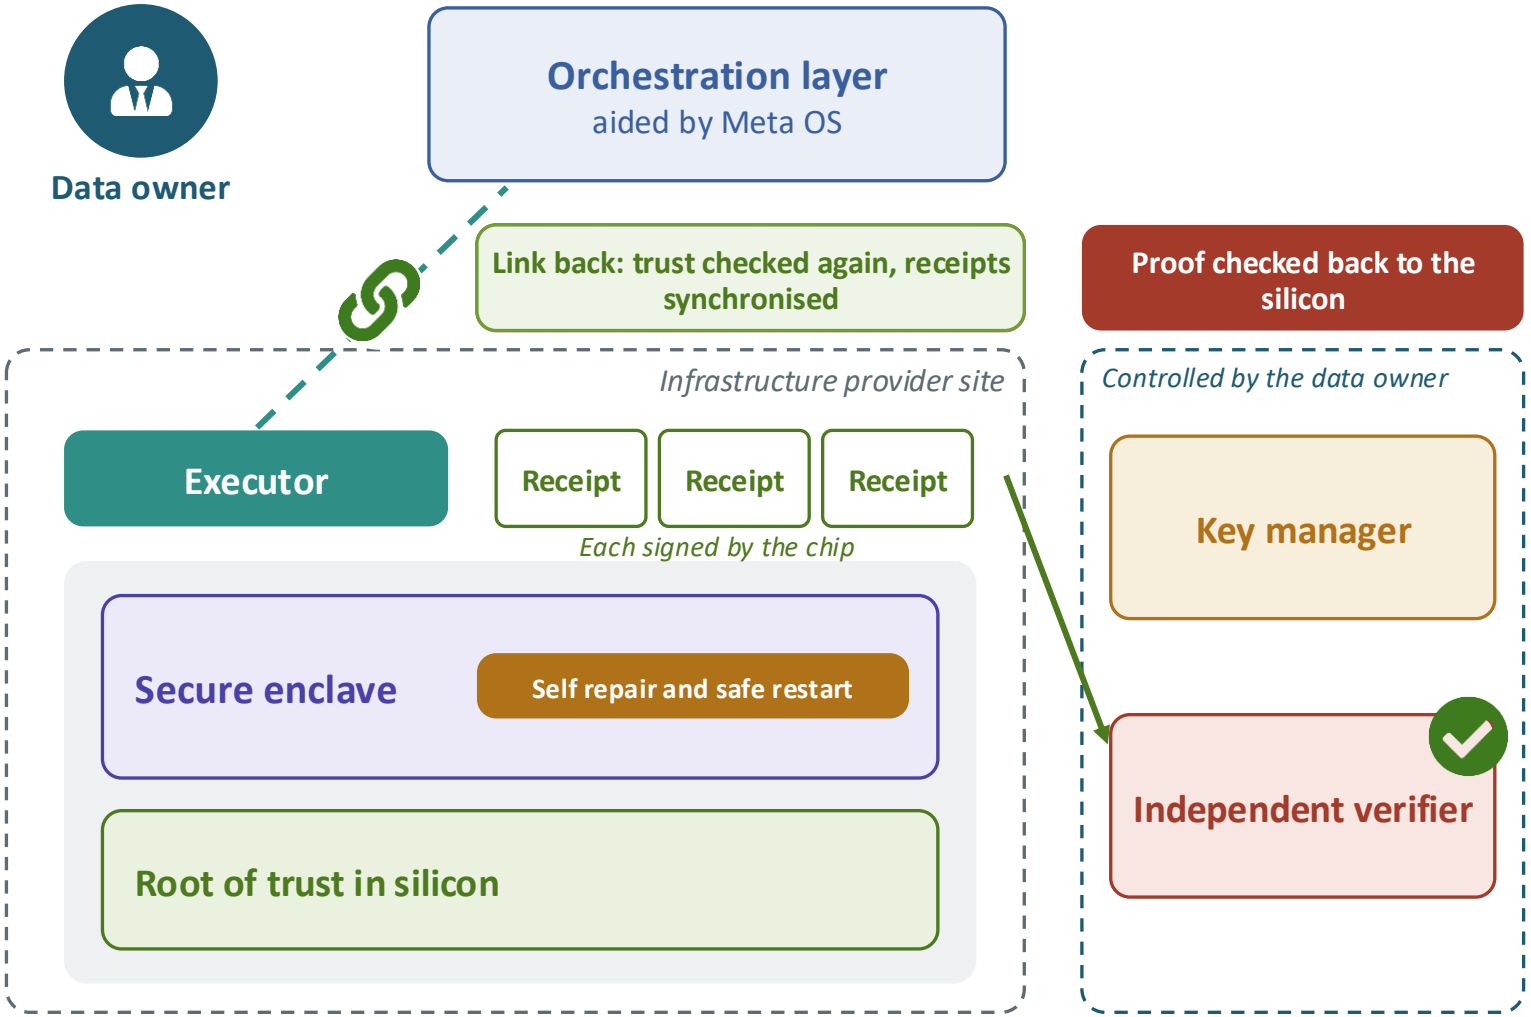

3. Before anything runs, the chip measures what started and signs this evidence with its own key.

   In trade: *the factory shows a certificate that cannot be forged.*

4. The verifier checks the evidence. Only then are the keys released and the data opened in the enclave.

   In trade: *the inspector approves before the container opens.*

Running, recording and staying trustworthy

5 The AI runs inside the enclave. Every action creates a signed receipt: model, data, rules and machine.

In trade: *a customs record for every processing step.*

6 If the link is lost, the site keeps working within its rules, keeps receipts sealed and can repair itself.

In trade: *a remote depot honours the contract on its own.*

7 When the link returns, trust is checked again first, then stored receipts are synchronised without gaps.

In trade: *the manifest is reconciled when the ship is back in port.*

8 The data owner, an auditor or a regulator can check every receipt independently, back to the chip.

In trade: *customs records that any authority can verify.*

Call to Action

- The challenge and the opportunity:
  - AI workloads are spreading OUTSIDE hyperscalers across the entire computing continuum, which introduces operational and security challenges.
  - We are proposing the **AICC Deployment Software Workstream** to develop open specifications and reference implementations for trustworthy AI deployment across heterogeneous infrastructure. We invite likeminded organizations to help establish it.
- How to engage:
  - Reach out to Steve Yates, Çağatay Yılmaz, Dirk Blevins or Vincent Nguyen if you are interested in contributing to AICC Deployment Software Workstream
  - Subscribe to the AICC mailing list and join the monthly callsfor AI Across the Computing Continuum
- Learn more:
  - Project: https://www.opencompute.org/projects/aicc

Thank You!
