Modular by Design: Building AI Clusters from Factory-Built Units

Bill Stube *R&D, Crusoe*

Alex Akesson *Product, Crusoe*

Vertically Integrated

01
Managed AI services
Platform as a service

02
AI cloud platform
Infrastructure as a service

03
AI data center infrastructure
Crusoe's modular, scalable build, fabricated by Crusoe Industries

04
Manufacturing
Manufacture internally for speed, cost, capacity and design optimization advantages

05
Strategic power sources
Grid, Wind, solar, hydropower, geothermal, natural gas, carbon capture, etc.

Why OCP

OCP open community

- Operators, OEMs and suppliers build to shared, open specs

AI density is outpacing how data centers get built

- Liquid cooling, higher-voltage power and a new GPU generations need common interfaces and industry approaches

Share our learnings from hyperscale deployments in the field

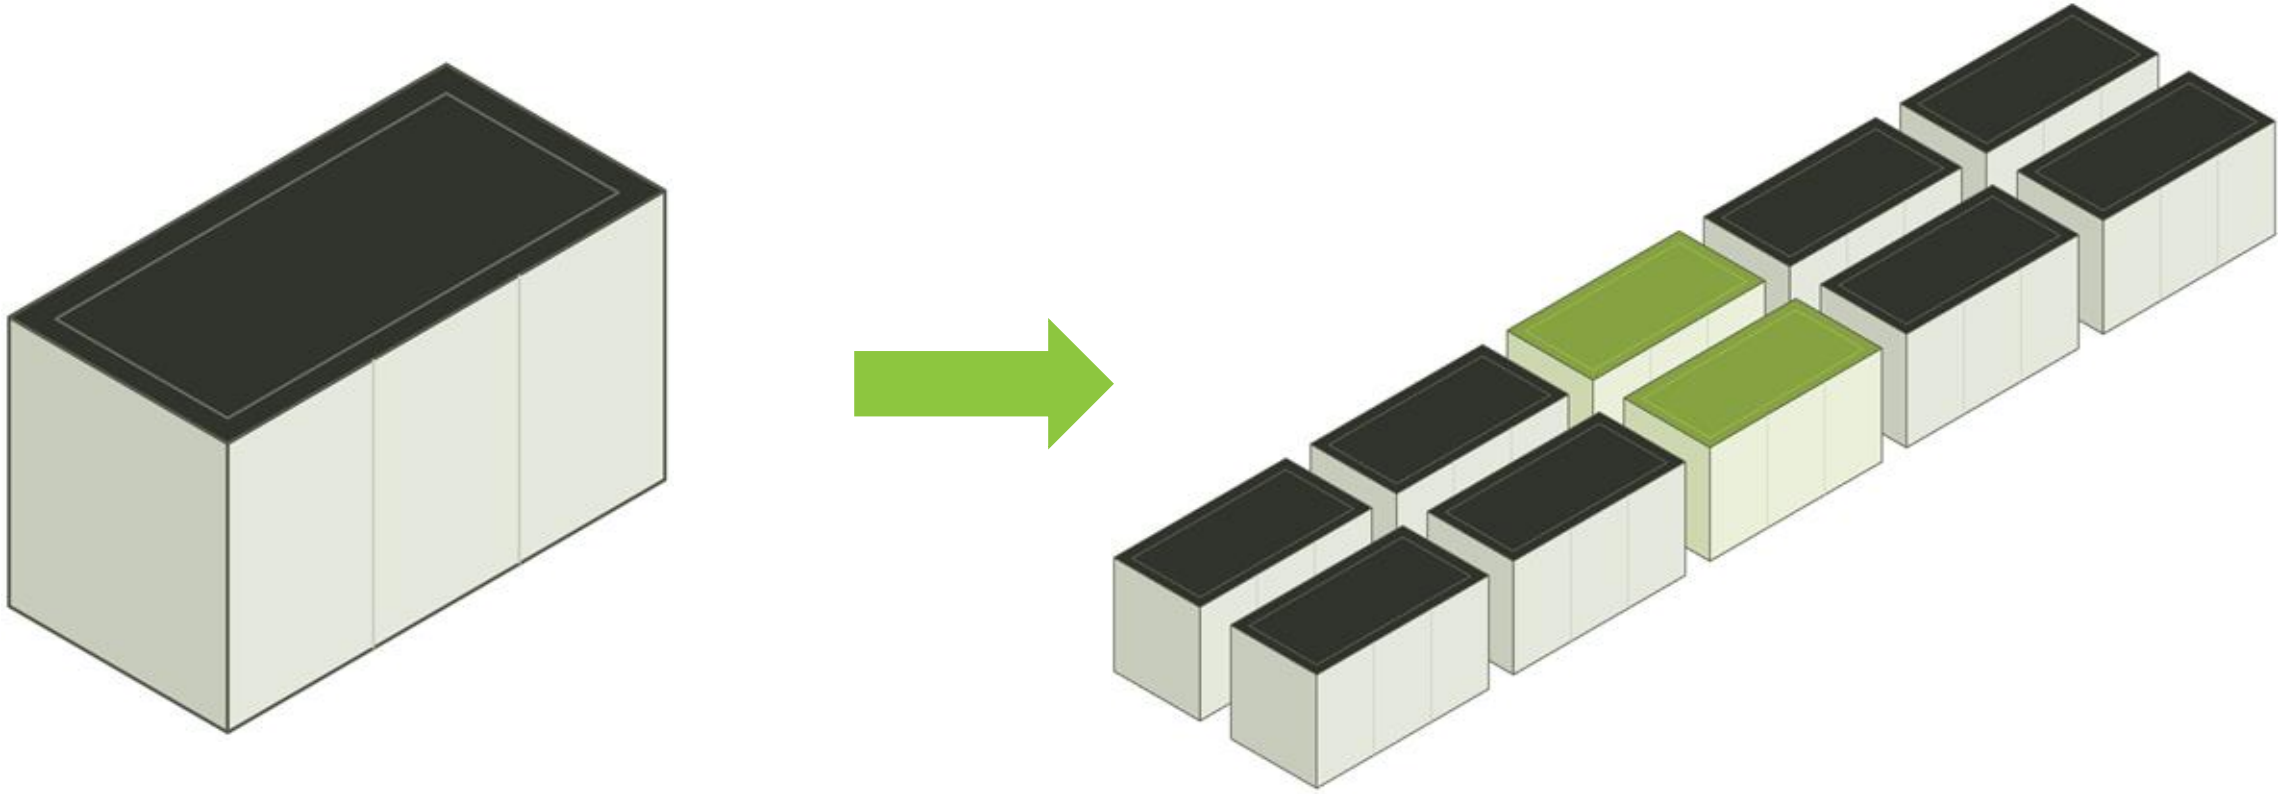

- Turn what we've learned from deploying factory-built units into an open spec the industry can build on

The Problem: Construction Is a Project, Compute Is a Product

	Traditional Data Center	GPU Cluster
1	Bespoke, sequential, and integrated in the field	Highly standardized: same racks, scalable units, fabric at every site
2	No manufacturing learning curve, quality found at commissioning	Known silicon roadmap: each unit generation designed to a GPU.
3	Field integration risk with growing density + liquid cooling + higher-voltage	Built and validated on a production line; quality caught in the factory

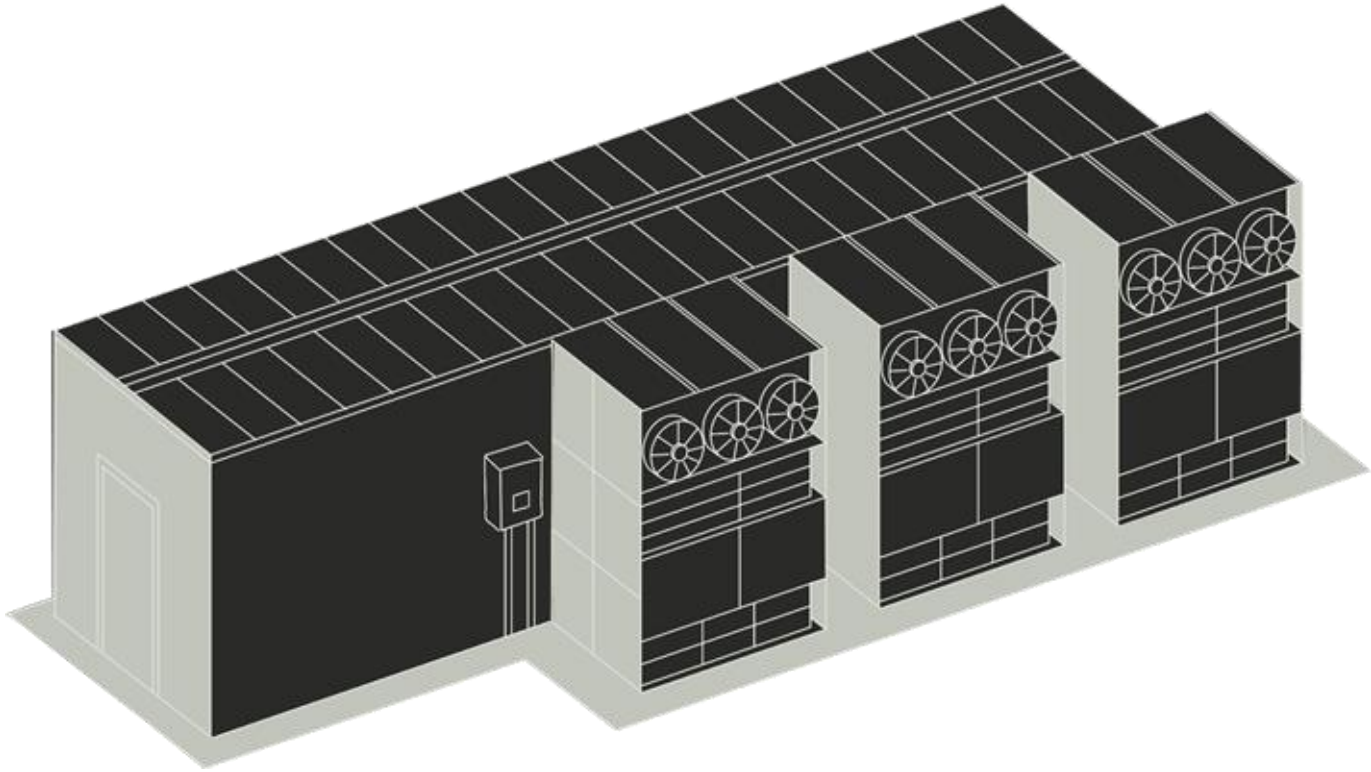

Deployment model that is faster, repeatable, and standardizable

The Proposal

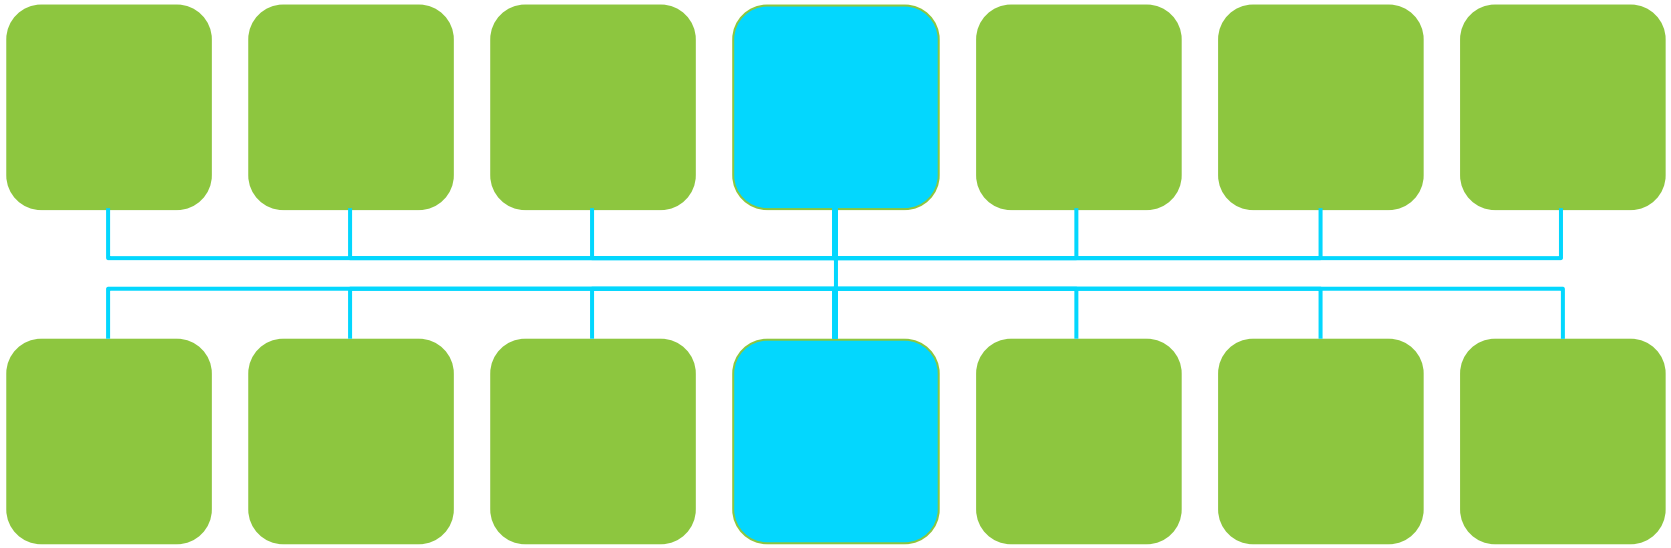

The Unit: Factory-Integrated Spec

- Engineered to support NVIDIA & AMD GPUs
- Power distribution (LV feed in)
- Cooling plant (Air/ DLC)
- GPU + Networking + Ancillary racks
- Structured cabling and patch panels
- BMS, Fire Suppression, IT/OT
- Expanded beyond traditional FAT

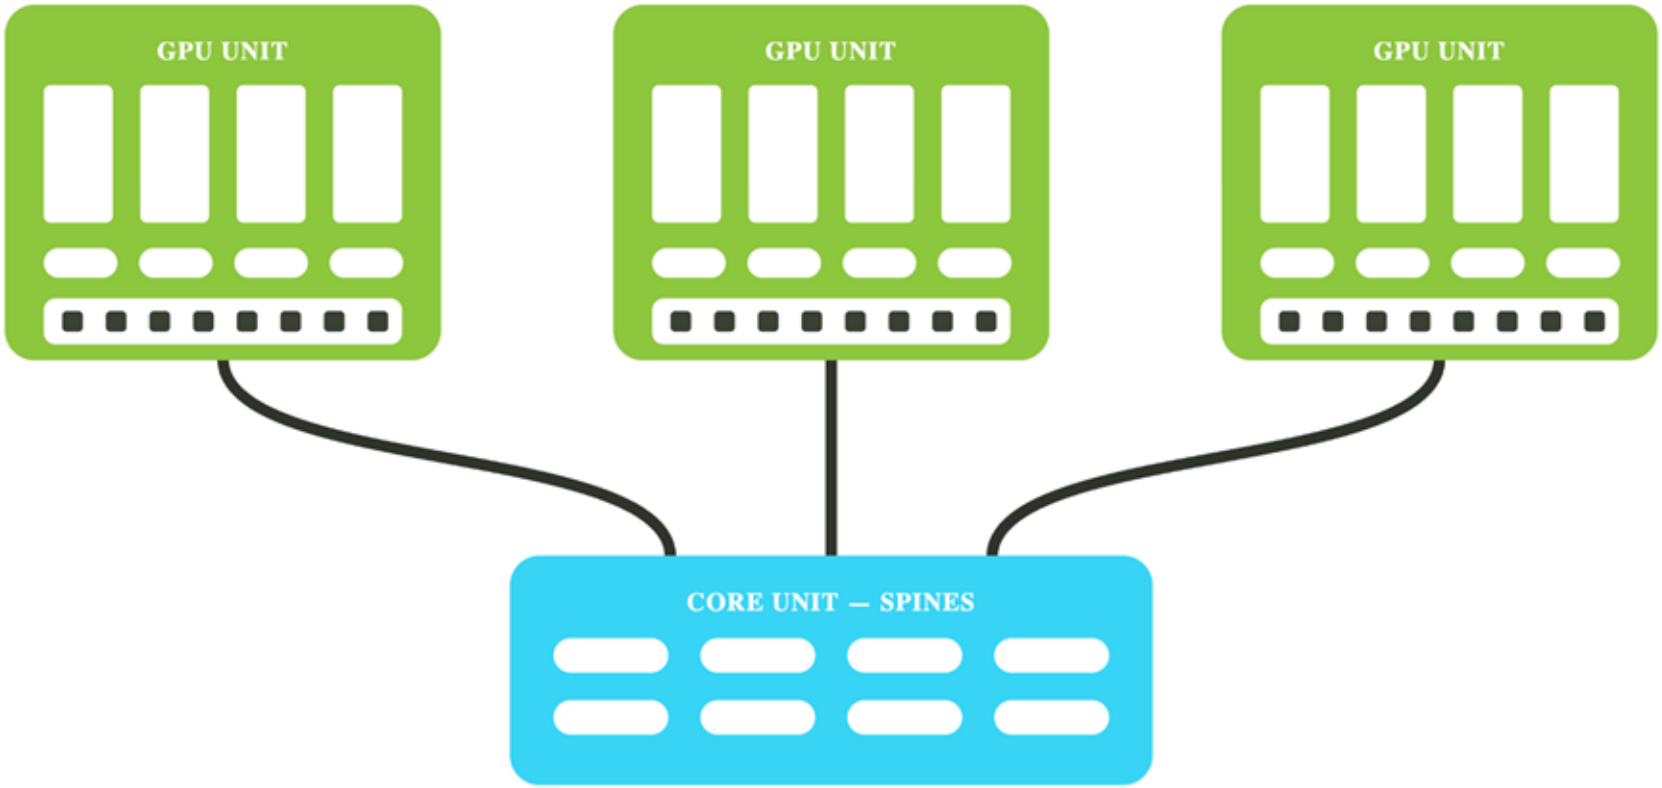

Reference Architecture: From Units to Cluster

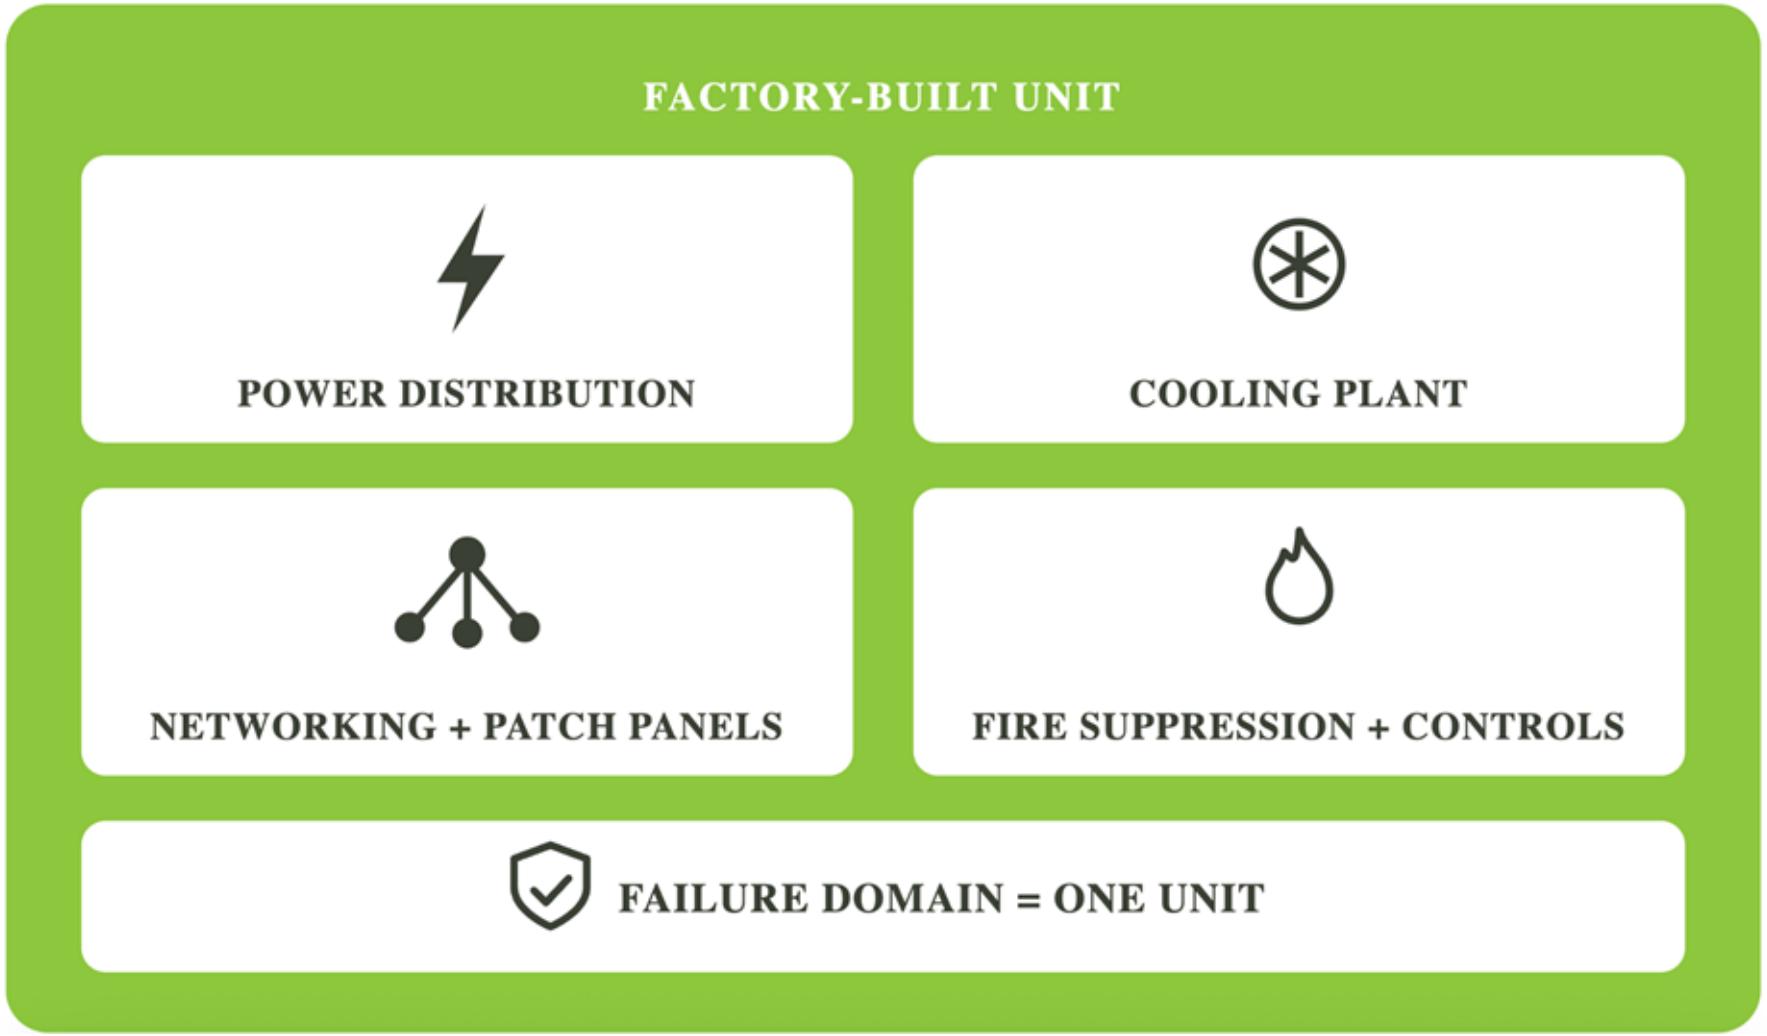

GPU Modular Units
GPUs Leaf switching Patch Panels Power Config & Redundancy Tiering

Networking & Ancillaries Modular Units
Spine switching Core routing Storage (Object/ Block) Ancillary Power Config & Redundancy Tiering

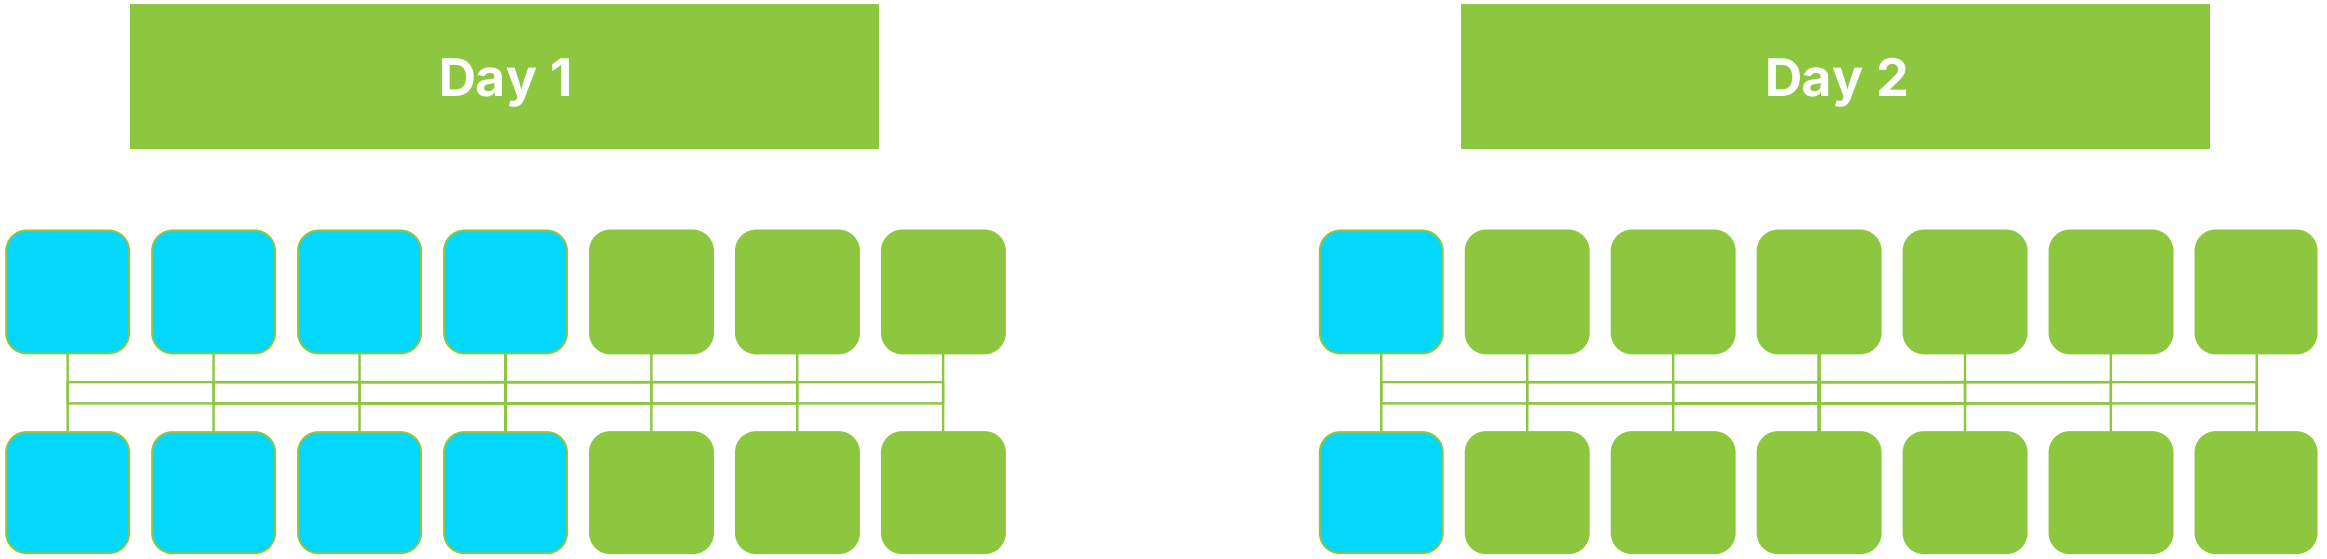

One Back-End fabric across all Units

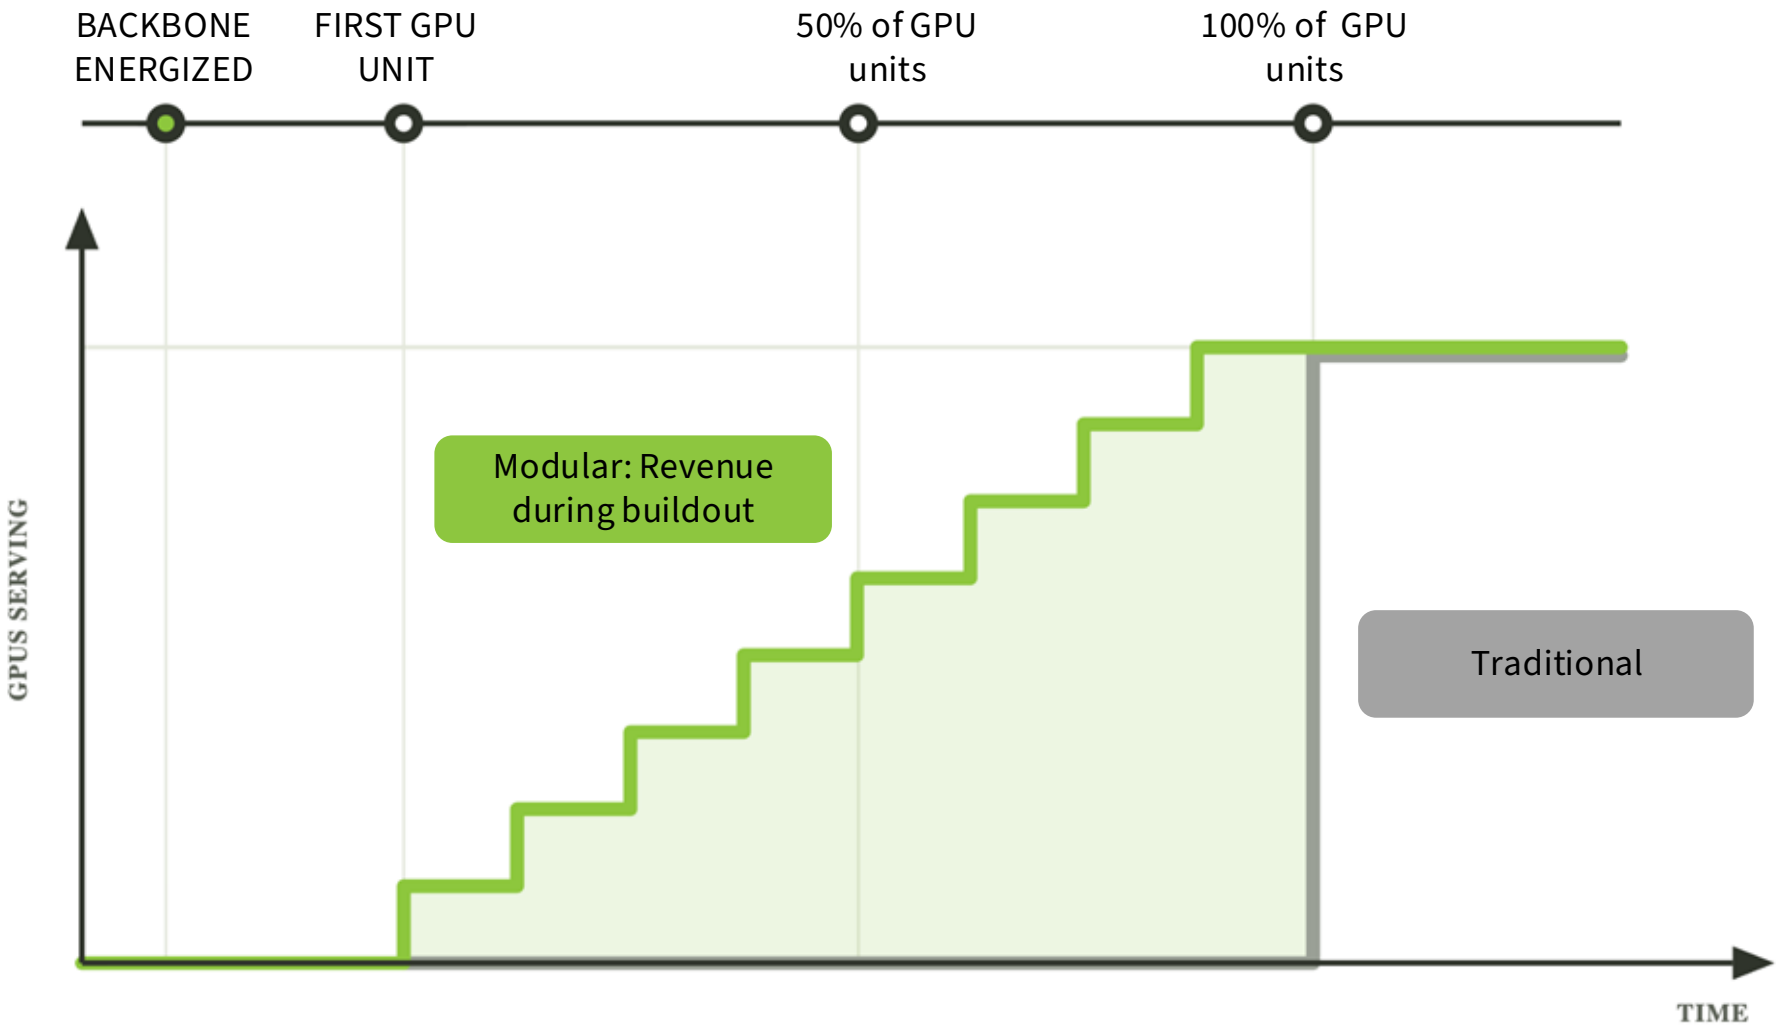

Power & Cooling: The Module is the Boundary

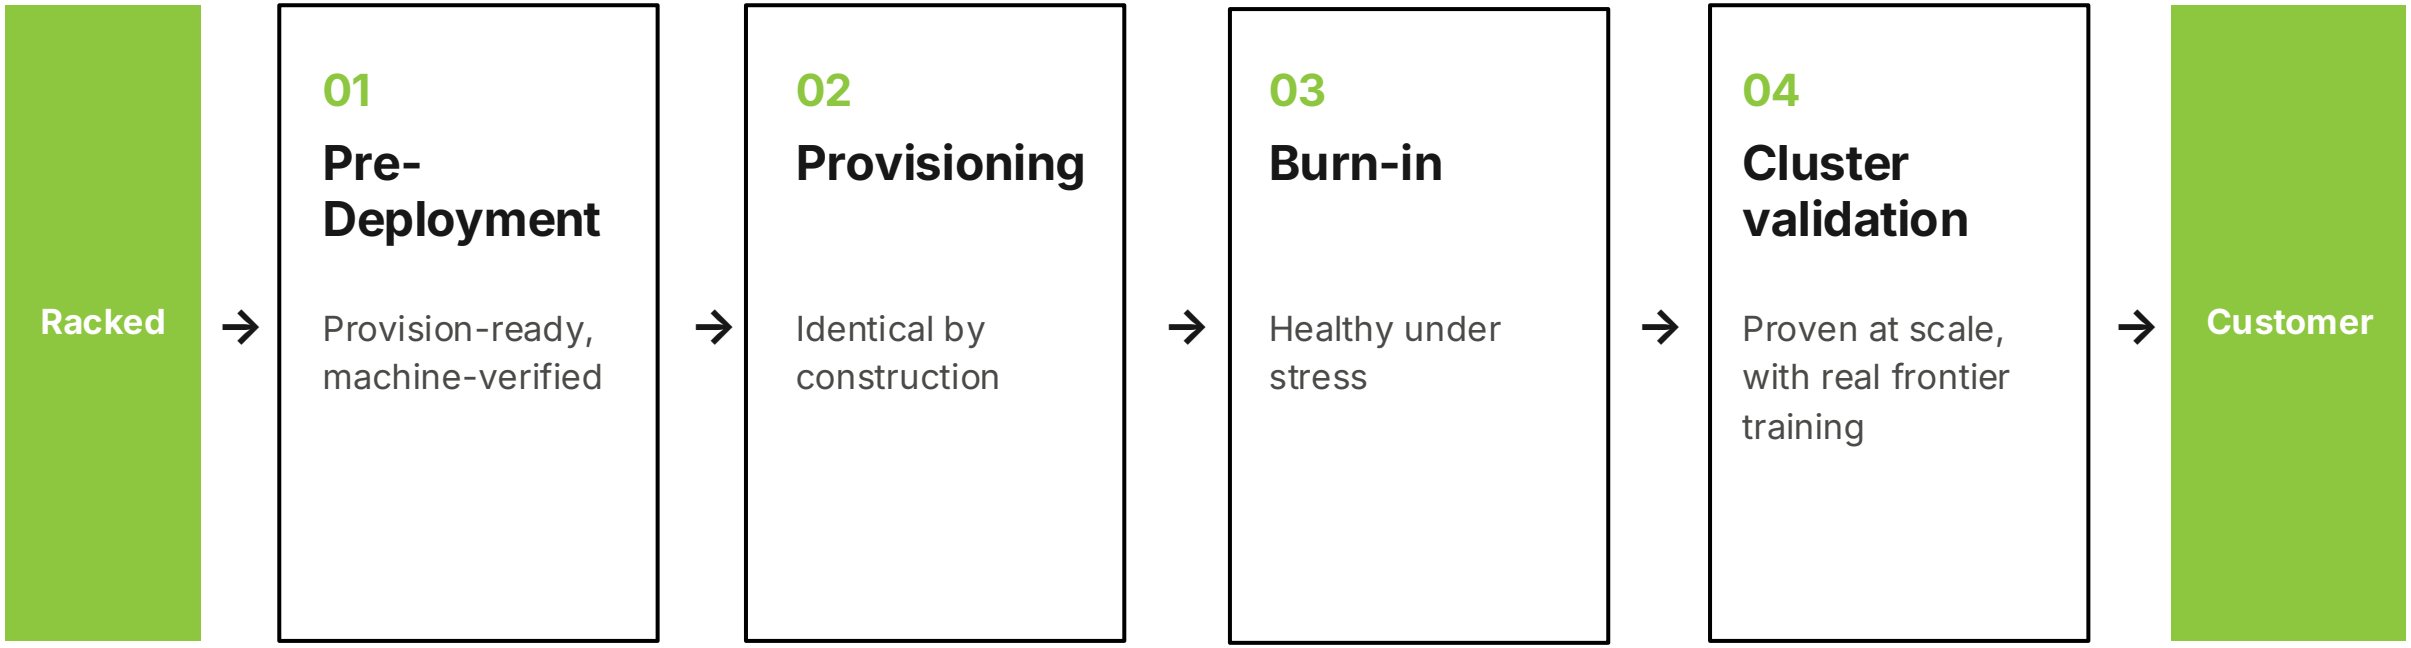

Logical Partitioning: Multi-Tenant without Recabling

Backbone-first sequencing for incremental energization

Making it AI-Ready

Call to Action

- Problem to solve
  - Let's create an open spec for building modular AI clusters, both the physical unit and its interfaces
- How to get involved in the project/sub-project community
  - Modular Data Center Sub-Project
- Where to find additional information
